

Railway Milestone Bug Fix Guide

A click-by-click beginner guide for installing v1.9.1 and changing countdown notifications yourself.

App:	TCG 1 Billion Monitor
Login:	#1Billion
Source:	tcgmachines.com/product
Fix:	Railway-controlled milestone schedule

What this bug fix changes

Before this update, adding another countdown point meant editing JavaScript and rebuilding the app. Version 1.9.1 moves the countdown schedule into one Railway variable. After you install this package once, ordinary milestone changes can be made from Railway without touching the code.

The one variable

MILESTONE_REMAINING

The final 1,000,000,000 alert is always added automatically.

Default schedule

Counter value	Notification
990,000,000	10,000,000 cards remaining
995,000,000	5,000,000 cards remaining
998,000,000	2,000,000 cards remaining
999,500,000	500,000 cards remaining
999,900,000	100,000 cards remaining
999,950,000	50,000 cards remaining
999,990,000	10,000 cards remaining
999,995,000	5,000 cards remaining
1,000,000,000	Final email and Teams announcement

Do not delete /data

Your Railway volume stores the email list and the one-time delivery locks. Keep the existing volume attached at **/data**.

Part A - Install the Railway bug fix once

1

Download the correct ZIP

Download the full package named **TCG-1-Billion-Monitor-v1.9.1-RAILWAY-MILESTONE-BUGFIX-FLAT.zip**.

2

Extract it on your computer

Open the ZIP and extract all files. You should immediately see files such as **index.html**, **Dockerfile**, **server.js**, and **milestones.js**. There must not be another project folder wrapped around them.

3

Open the GitHub repository connected to Railway

Sign in to GitHub and open the same repository that your working Railway service is already connected to.

4

Upload the replacement files

In GitHub, use **Add file**, then **Upload files**. Drag every extracted file into the upload area. Upload the files themselves - not the ZIP.

**Root means
root**

When the repository opens, **index.html**, **Dockerfile**, and **server.js** should be visible immediately. They should not be inside another folder.

5

Commit the upload

Use the commit message below and commit to the branch Railway deploys, normally **main**.

Install Railway milestone bug fix v1.9.1

6

Wait for Railway

Open Railway, select your project and service, and open **Deployments**. The GitHub commit should start a deployment automatically. Wait for the newest deployment to say **Active**.

Part B - Add the milestone schedule in Railway

1

Open the Variables screen

In Railway, open the TCG monitor service and select the **Variables** tab.

2

Create the variable name

Add a new service variable with this exact name:

```
MILESTONE_REMAINING
```

3

Paste the value

Paste this exact value:

```
10000000,5000000,2000000,500000,100000,50000,10000,5000
```

Plain digits only

Do not type **10,000,000** inside the variable. Use **10000000**. The commas in the example separate one notification from the next.

4

Apply the staged change

Railway stages variable edits. Review the staged changes, then press the button to deploy or apply them. The wording may be **Deploy**, **Apply**, or **Review changes**.

5

Wait for Active again

Open **Deployments** and wait until the newest deployment says **Active**.

Your other secrets stay put

Do not delete SMTP, Teams, password, or cookie variables. You are only adding or updating **MILESTONE_REMAINING**.

Part C - Prove that the fix worked

1

Open the health page

Take your normal Railway app address and add **/healthz** to the end. Example:

```
https://your-app.up.railway.app/healthz
```

2

Look for the new version

The page should show JSON containing:

```
"version": "1.9.1"
```

3

Check the milestone list

The same page should contain:

```
"milestoneCount": 9  
"countdownRemaining": [10000000, 5000000, 2000000, 500000, 100000, 50000, 10000, 5000]
```

4

Open the normal app

Remove **/healthz**, open the normal app, and log in with:

```
#1Billion
```

5

Test both delivery methods

Press **Send test email**, then **Send test post**. Confirm the email arrives and the Teams message appears. Test messages do not use up milestone locks.

**No current
counter
change
required**

The test buttons prove the delivery connections. They do not pretend that a real countdown threshold has been reached.

Part D - Change milestones yourself later

After v1.9.1 is installed, you normally do not need another code package. Edit the Railway variable, deploy the staged change, and check /healthz.

Example: add a 20-million and 1-million notification

```
MILESTONE_REMAINING=20000000,10000000,5000000,2000000,1000000,500000,100000,50000,10000,5000
```

Example: use a shorter schedule

```
MILESTONE_REMAINING=10000000,5000000,1000000,100000,10000
```

Final alert is protected

The app always adds the 1,000,000,000 final notification, even if you do not type it in the Railway variable.

The repeatable four-step routine

- Open Railway -> your service -> Variables.
- Edit MILESTONE_REMAINING using plain digits.
- Review and deploy the staged change.
- Open /healthz and confirm the list.

Important threshold warning

If the live counter has already passed a newly added threshold, that new email and Teams post can become eligible after two verified readings. Check the live counter before adding a past threshold.

Troubleshooting checklist

Problem	What to check
Railway did not deploy	Confirm the GitHub commit is on the branch connected in Railway service settings.
Health page still says 1.9.0	Railway is still running the old commit. Open Deployments and deploy the latest commit.
Milestone list did not change	Check the variable name spelling, use plain digits, then deploy the staged variable change.
Recipients disappeared	Check that the existing volume is still attached at /data. Do not create a new empty volume unless the old one
Email test fails	Check SMTP_HOST, SMTP_PORT, SMTP_USER, SMTP_PASS, and MAIL_FROM.
Teams test fails	Check TEAMS_ENABLED and the complete TEAMS_WEBHOOK_URL.
A new old threshold sends immediately	The alert had already crossed it. New thresholds become eligible after two verified readings.

Safe rollback Railway keeps deployment history. If a new deployment is bad, use the previous deployment action to redeploy or roll back, then correct the code or variable.

Official reference points

Railway documentation confirms that GitHub-connected services can autodeploy new commits, variable edits are staged for review and deployment, and a mounted volume provides a persistent directory to the running service.

Prepared for TCG Machines - version 1.9.1
